COMP4050 Week 6

All members attended this meeting.

Minute taker: Ameer Karas

Agenda:

<mark>Completed</mark>

- Add past week's work to Trello
- <mark>Add new fields to database: skills and whatever else we can think of.</mark>
- <mark>Look at mobilePhone issue; supposedly working on main branch, not working for some of us.</mark>
- Assigning userID to an active job; someone volunteering to do the job on swapstreet.
- Make users unable to apply for a job they've listed.
- Code trace for how job status is updated.
- Implement distance radius for jobs.
- <mark>Adding skills to the user profile as an array of strings.</mark>
- <mark>Add a skills input box to registration.</mark>
- With new input boxes for register, fix up back end so it handles new data.
- Add a display picture to profile edit.
- Implement a 'delete' feature for jobs.
- Tony and Chris: map feature.
- Bookmarked favourites

Notes:

- Josh wants to implement 'current jobs'
- Chris and Katrina added sections to dashboard from wireframe, did a nice re-work.
  - Tried to link it to back-end
  - Datarouter is complicated
  - They re-did the links in the datarouter class to be able to access the back-end
  - Tried to make front-end as close to wireframe as possible.
- Need to look at cookie and storage settings.
- Tony worked on the map
  - Blue markers are for the users.
    - Each marker should represent the address of a user
  - One problem: can't get the local storage.
  - Tony wants one blue marker to be shown on the map, representing where the current user's address is.
- Ameer and Josh worked on active listings
  - Calls on jobcontroller; if there's a new job being added, it will check if there has been a query and then get all fields for that job then adds these fields to the database.
- Ameer, Katrina and Chris have encountered issues where their IP addresses have changed, resulting in being restricted from accessing the database.
- Chris and Katrina were going to do all of the basic styling and then do the responsiveness afterwards.

Tasks completed this lesson:

- Added user skills
- Tony: Worked on the markers for the map
  - Getting the user markers to work, and the job markers to work using google maps
  - Displays a "home" marker for the user
  - Previously it showed markers for all the users.
- Josh and Ameer:
  - Creating new active jobs under the userID.
  - Fixing some back-end bugs and adding to the data collections.
- Chris and Katrina
  - Altered display of the dashboard to make it look like the wireframe
  - Used what Josh and I did to display job status on the correct page and in the correct style.
  - Design front-end features

Kate's final words:

- The whole idea of a 360 review is to get feedback from peers, boss and subordinates.
- There is a template on ilearn for reflection.
