Week 11 Meeting Notes

- Adding comments to the code files to identify which member has completed which section
- Discussion about adding user comments to user profiles.
    - Potentially adding a one-word remark
    - Users have the skills on their page, they could get rated based on their skills
    - If we add user comments with CSS it may alter the layout of the page.
- Team members are contemplating whether it is feasible to add a comments function to our system.
- To change the rating system to affect each user's skills would require a back-end restructure
    - We would have to change how the current rating system works as well.
- Adding error-handling and bug fixes should be our highest priority right now.
- Our structure across the semester:
    - Sprint 1 we planned
    - Sprints 2 and 3 we developed
    - Sprint 4 we will be reviewing
- We are now approaching the final sprint as a touch-up period. We will be testing our system for exploits, flaws and user friendliness. To properly test user friendliness, we will get some of our peers to attempt to navigate the system and correctly use SwapStreet.
- Map and search gets slow; every time you return to the home page it sends another request to the Google Maps API. Additionally, every marker on the map (representing a job on the side bar) sends a separate request.
    - Refreshing the page remedies this.
    -
